### HIF1 alpha antibody GRP65

<b>Description</b>	Hypoxia-inducible factor-1 (HIF1) is a transcription factor found in mammalian cells cultured under reduced oxygen tension that plays an essential role in cellular and systemic homeostatic responses to hypoxia. HIF1 is a heterodimer composed of an alpha subunit and a beta subunit. The beta subunit has been identified as the aryl hydrocarbon receptor nuclear translocator (ARNT). This gene encodes the alpha subunit of HIF-1. Overexpression of a natural antisense transcript (aHIF) of this gene has been shown to be associated with nonpapillary renal carcinomas. Two alternative transcripts encoding different isoforms have been identified. [provided by RefSeq]

ChIP was performed with HepG2 chromatin extract and 5 µg of either normal rabbit IgG or anti-HIF1 alpha antibody. The precipitated DNA was detected by PCR with primer set targeting to VEGF promoter.

HIF1 alpha antibody detects HIF1 alpha protein at nucleus on human kidney cancer by immunohistochemical analysis. Sample: Paraffin-embedded human kidney cancer. HIF1 alpha antibody (GRP517) dilution: 1:500.
